

**Amendments to the Specification**

Please replace paragraph [0031] with the following paragraph:

In one embodiment, when cell phone 104 is coupled to PDA 102, the resources in the PDA and the cell phone are shared such that the processor unit(s) in the PDA functions as the host processor(s), while the processor unit(s) in the cell phone functions as the peripheral. For example, the cell phone resources for transmitting and receiving of the digital and/or analog signals may be used by the PDA to place or receive telephone calls via the PDA. In this embodiment, the PDA display may be modified from conventional displays so that a strip of information relating to the cell phone may be displayed within the PDA display. An example of such a display is shown in Fig. 43. In Fig. 43, the strip along the top of the display provides the same information (such as the remaining battery charge and reception strength) normally provided on the cell phone display. This enables the simultaneous use of the cell phone and such PDA functionalities as the calendar function or word processing function.
